12. Find your mass in grams (start with your weight in pounds).
13. How many cups of water are there in 6 gallons?
14. A typical human weighs 150 pounds and takes in 3,000 calories per day. A typical whale weighs 50 tons and needs 395,000 calories per day. A whale may spend 15 hours a day feeding during the summer season.
a. How many pounds (lbs) does a typical whale weigh? (look at your conversions on the front)
b. Here is a "rate" problem (from last homework):

How many calories / hour does a typical whale take in?
c. Use your above rate and your knowledge of conversions to determine how many calories / second a whale takes in.
